1039. L. A. Galin, "Impact on a rigid body resting on the surface of a compressible fluid" (in Russian), *Appl. Math. Mech. (Prikl. Mat. Mekh.)*, Sept.-Oct. 1917, vol. 11, pp. 547-550.

A rigid body of mass m and length l strikes the surface of a compressible fluid of density ρ with velocity v_0 normal to the fluid surface, initially at rest. On the assumption of a scalar potential function $\phi(x, y, t)$, the normal stress and the displacement v in the y -direction will be respectively $\sigma_y = \lambda(\phi_{xx} + \phi_{yy})$ and $v = \phi_y$. $\phi(x, y, t)$ will be a solution of the wave equation $\phi_{xx} + \phi_{yy} - (\rho/\lambda)\phi_{tt} = 0$ where λ is the Lamé constant, and the second Lamé constant μ equals zero.

For the time interval $0 < t < (l/2)(\rho/\lambda)^{1/2}$, the author finds the exact solution for the motion of the rigid body after impact to be

$$y = (\rho/\lambda)^{1/2} [\exp \{a_1(\lambda/\rho)^{1/2} t\} - \exp \{a_2(\rho/\lambda)^{1/2} t\}] / \lambda(a_1 - a_2)^{-1}$$

where $a_1, a_2 = (l\rho/2m) \pm [(l\rho/2m)^2 - \rho/m]^{1/2}$. The force on the body in this time interval will be $F = mg$.

For $(l\rho/2m) > 1$, the force on the body will continuously increase during the specified interval; for $(l\rho/2m) < 1$, the force may change sign, with consequent rebound of the body from the fluid.

BCG-vaccination in tuberculosis control PRAKT. LÉK. 1955,
35/15-16 (341-344) Graphs 1

Mass-vaccination with BCG started in Czechoslovakia in 1949. In Prague the rate
of vaccinated children and youth up to 20 yr. reached 75% in 1951. In this year
175 cases of tb occurred in the group of unvaccinated persons under 20, against
19 cases in the group of vaccinated persons. Regional lymphadenitis developed in
about 0.5% of the vaccinated children. Less complications of this sort were ob-
served among children vaccinated with a vaccine produced in Prague than among
those inoculated with the vaccine supplied from Copenhagen. No adverse influence
on weight-gain was observed in vaccinated newborn infants, not even in prematures.
Before vaccination, millions had to be spent for the hospitalization of tuberculous
children.

Title	: Cultivation of BCG and M-P Strains on Dubos Nutritive Medium With a BCG Culture Filtrate as an Albumin Substitute	
Orig Pub.	: Rozhl. tuberk. a nemocch plionich., 1957, 17, No 4, 260-265	
Abstract	: Using the usual method of preparing BCG vaccine, a culture from Sauton's medium is ground up with small metal balls and, therefore, contains a certain number of dead and injured bacteria and fragments of them. Dubos suggested growing vaccine strains on a liquid medium with the addition of Tween-80, which brings about a diffuse growth of the culture which then collects at the bottom of the flask. In this way, the possibility is obtained of preparing the vaccine without preliminary grinding. Because commercial Tween contains a certain quantity of free fatty acids which are toxic to mycobacteria, Dubos adds bovine serum albumin to the culture medium; this

Abstract : neutralizes the toxic effect of the Tween and, in addition, stimulates the growth of the mycobacteria. Vaccine prepared according to the Dubos method gives a higher percentage of positive and stronger reactions than the usual vaccine on intracutaneous testing, which is apparently explained by the higher content of live bacteria in it. The main objection to the use of vaccine prepared according to the Dubos modification is the impossibility of reliably sterilizing the serum albumin for purposes of preventing the possibility of transmission of virus infections. Therefore, the authors replaced the human albumin in Dubos' medium

"Pulmonary Edema in Pigs and Its Treatment with a Mixture of Pipolphen and Novurit"

Budapest, Magyar Allatorvosok Lapja, Vol 21, No 6, Jun 1966, pp 253-255.

Abstract: The incidence of pulmonary edema in pigs owned by private individuals, observed since 1954 in the Eger area, was attributed to the ingestion of germinating wheat kernels. The disease took the intestinal, intestinal + pectoral, or the pectoral course. A combined treatment with Pipolphen (dimethylaminopropylphenothiazine-HCl), an antihistaminic drug, and Novurit (hydroxymercurimethoxypropylamide camphoric acid sodium + teophylline) was effective. The observations were described and discussed in some detail. No references.

 TOPIC TAGS: lightning, anemometer, transistor, weather forecasting, meteorologic instrument
 ABSTRACT: A CCIR-Sullivan five-channel, transistorized lightning counter was set in operation at the Marczell Gyorgy Observatory [original-language version not given] in Budapest. Four of the channels are sensitive to ground discharges occurring at distances of 20, 50, 80, and 100 km., respectively; the fifth channel perceives both ground- and cloud-discharges. The number of lightnings is recorded in a postal-type signal recorder; two channels are recorded also by a device adapted from a Robinson-type anemometer. The construction of the system was described and illustrated. The applications of the device in meteorological research and forecasting were discussed. Orig. art. has: 3 figures. [Orig. art. in Eng.]

Portable apparatus for determination of carbon dioxide, carbon monoxide, sulfur dioxide, and hydrogen sulfide. J. S. Dytkaiewicz, H. Gallus, J. Muzyczak, W. Olpiński, and J. Rozjans (Główny Inst. Górniczy, Bytom, Poland).

Akad. Pracy 9, 121-38 (1958) (English summary).—A known vol. of air is passed through 3 coupled washing sets: CO₂ is absorbed in the 1st one, contg. 0.1 or 0.01N Ba(OH)₂; CO is then oxidized to CO₂ by passing through I₂O₅ and absorbed in the 2nd set, also filled with Ba(OH)₂. SO₂ and (or) H₂S, if present, are absorbed along with CO₂ in the 3rd part of the app. H₂S can be disregarded in analyzing air in coal mines, but not in factories processing S ores. In order to det. SO₂ and H₂S, the first set is filled with 0.005N I. H₂S reacts releasing 2H⁺, while SO₂ releases 4H⁺; both gases can be estd. by detg. uncompoundd I and total acidity in the washing soln. and, both detns. are carried out in a 2-step titration operation with standard Na₂S₂O₄. The first step gives the amt. of I reduced by H₂S and (or) SO₂, and the second one, after addn. of KIO₃, determines acidity according to the equation $5I^- + IO_3^- + 6H^+ \rightarrow 3I_2 + 3H_2O$. When SO₂ and (or) H₂S are analyzed, the second set of the app. is filled with 10% KI applied to prevent escape of I vapors. The error of all detns. is negligible. The app. and its details are given. J. Laine.

TITLE: A dynamometer for measuring static and dynamic forces. Class 42, No. 183442

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 93

TOPIC TAGS: torque, measuring instrument

ABSTRACT: This Author's Certificate introduces a dynamometer for measuring static and dynamic forces. The instrument contains an elastic element, interferometer and registration unit. The device is designed for improved measurement accuracy, increased sensitivity and minimum time lag in the interferometer. The elastic element is made in the form of a cylinder with a movable section in which the movable interferometer mirror is mounted. The interferometer is firmly fastened to the stationary part of the element and has two outputs producing an interference pattern and signals proportional to deformation of the elastic element. These signals are sent from photomultipliers to the registration unit. The photomultipliers are mounted on the outputs and are displaced in phase by an angle of 90° .

"Examinations of Organ Activity Carried Out with Iodine¹³¹-Hippuran in Rats and Rabbits with Renal Occlusion and Acute Uremia"

Budapest, Magyar Radiologia, Vol 18, No 6, Dec 66; pp 365-372.

Abstract [Author's English summary]: The accumulation of iodine¹³¹-hippuran has been examined by author in rats and rabbits with experimental renal occlusion and acute uremia. The activity of the kidneys has been determined by means of homogenization. It is stated that the results of homogenization are fairly well suitable for the observation of the development of hydronephrosis and for the determination of the function of the kidneys. In the case of uremia, the results obtained are considerably poorer because of the death of the animals. 7 References, of which 3 Hungarian, rest Western.

TITLE: Quantitative determination of two γ -radiating isotopes¹⁹ in the presence of each other with the aid of a single-channel amplitude analyzer. Part 2

SOURCE: Magyar kemiai folyoirat, v. 71, no. 6, 1965, 234-238

TOPIC TAGS: gamma radiation, radioisotope, quantitative analysis, electronic test equipment

ABSTRACT: The method described for the determination of two γ -radiating isotopes in the presence of each other (such as Na-22, I-131, and Cs-137) is based on the method described by COVELL, D. F. (Analytical Chemistry, Vol 31, 1959, p 1785). The modifications of the original procedure were described and some results were presented to illustrate the applications of the modified technique. The principal advantage of the modifications is that they enable a determination to be completed in 20-25 minutes, as compared to 1.5 - 2 hours for the original method. Orig. art. has: 5 tables, 12 formulas.

(including tests) of thin shells with double curvature. Pt. I (in
Romanian), Indust. Constr. Mater. Constr. 9, 11, 627-635, Nov.
1957.

Experimental studies were carried out by Research Institute
ICINC with new type of thin shell roofs in reinforced concrete,
standardized types spanning from 12 to 24 m (36-78 ft). Three-
hinged precast arched sections have rise $\frac{1}{4}$ of the span (7.2-
15.6 ft) and width $\frac{1}{2}$, length (3-6 ft), with constant thickness 4
cm (1 1/2 in.). Standard reinforcing is 1.12 p.c. in longitudinal and
0.25 p.c. in transverse direction. Tests were made with quarter-
size models and also on full-size structure with average span of
18 m (59 ft). Deflections under various loading (uniform, partial,
concentrated) and safety factors are recorded.

TITLE: Continuous Converting of Mattes (Nepriyemnoye
konvertirovaniye shteynov)

PERIODICAL: Tsvetnyye Metally, 1959, Nr 2, pp 27-34 (USSR)

ABSTRACT: The authors discuss some shortcomings of the present converter process, the chief of which is its discontinuity. They discuss the heat balance of the process in terms of the variation of the calorific value of the matte and minimal permissible blast utilisation with variation in its copper content (Fig 1 and 2 respectively). Preliminary tests showed that blowing the matte in suspension was not effective and the authors concentrated on top blowing through water-cooled tuyeres of the matte flowing through a container (Fig 3). Work with cold hydraulic models and hot laboratory-scale installations was followed by tests on a 1-tonne (matte) hot installation at the Balkhashskiy Medepilavil'nyy Zavod (Balkhash Copper-smelting Works).
Card 1/3 This (Fig 4) consisted of a cylindrical horizontal

Continuous Converting of Mattes

SOV/136-59-2-7/24

furnace rotatable about a vertical axis. The furnace was lined with chrome-magnesite brick with heat insulation and had a welded iron shell. The matte entered at one end where the tuyere was located and flux was added, while the slag left at the other end. A type ZIF-51 compressor (rated at 200 nm³/hr at up to 6 atm gauge) and oxygen cylinders provided the blast. Facilities for temperature, gas-composition and flow measurements were provided. Observations of the interaction between the blast, matte, slag and lumps of flux (Fig 5) showed that a tuyere inclination was an important factor. Fig 6 shows the degree of utilisation of oxygen (%) as a function of tuyere inclination (degrees) for heights of tuyere nose above the surfaces of 150 to 200 mm (curve 1) and 250 to 300 mm (curve 2). Optimal conditions for air blowing were established as 70 to 80° tuyere inclination, 4 to 5 atm gauge blast pressure, 300 to 350 mm tuyere-nose height above bath. The results (table 1) showed that the tuyere height above the bath could be increased without reducing oxygen utilisation by oxygen-enrichment of the blast. Chemical

Card 2/3

Continuous Converting of Mattes

SOV/136-59-2-7/24

compositions of products obtained under the above optimal condition with air blast (tables 2 and 3) were 0.37 to 1.64 and 23.58 to 28.80% Cu and SiO₂, respectively in slag and 72.66 to 78.49 and 98.52 to 99.60% Cu in white matte and crude copper respectively. The authors outline one of their proposed continuous-converter processes (the converter is shown in Fig 7) put forward on the basis of their experimental results. They propose a blast pressure of at least 6 to 10 atm gauge and suggest that because of its high concentration the SO₂ in the converter waste gas could be utilised. They consider the process particularly attractive with blast oxygenation and applicable to various materials e.g. ferronickel. There are 7 figures, 3 tables and 2 Soviet references.

AUTHORS: Gal'nberg, A.A. and Rotinyan, A. L.

TITLE: The mechanism of metallic losses in electrolysis of fused salts

PERIODICAL: Zhurnal prikladnoy khimii, v. 35, no. 6, 1962,
1314-1322

TEXT: The lowering of current efficiency of Pb and Zn, in the electrolysis of $PbCl_2$ and $ZnCl_2$ respectively were determined in relation to current density (D) and temperature, under various conditions, to explain the mechanism of such losses. The latter increased linearly with D between 0 - 0.32 A/cm² and were also higher at higher temperatures; e.g. for Pb at 0.24 A/cm², losses were $\sim 10^{-4}$ g.atom/cm² of cathode hr at 550°C, rising to $\sim 11 \times 10^{-4}$ at 750°C. The losses occurring when D = 0 are ascribed to a "mechanical" cause, specifically to the dissolution of metal in the melt, transport to the surface and volatilization or oxidation. The extent of

Card 1/3

The mechanism of ...

S/080/62/035/006/011/013
D204/D307

such losses is, therefore, governed by hydrodynamic factors such as stirring. The losses proportional to D were termed "electrochemical" and could not be explained by (1) increased circulation of the melt due to stirring with anodic gases, (2) kinetics of the electrode process, or (3) existence of a partial electronic conductance in the melt. It was, however, observed that electrochemical losses did not occur in the absence of anodic gases. At 600°C , with $D = 0$, the electrochemical loss of Pb increased linearly with the amount of gas bubbled through the fused electrolyte, but was independent of the gas itself (Cl_2 , N_2 , air). A corresponding

straight line relationship was observed between the loss and current strength during electrolysis, when no extraneous gases were introduced. Such losses are thus ascribed to the entrainment of volatilized products, formed when the metal dissolves in the melt, with the anodic gas bubbles, followed by escape of the mixed vapors from the system. There are 9 figures.
